"Primary structure of proteins from the wing cuticle of the migratory locust, Locusta migratoria.";
Insect Biochem. Mol. Biol. 25:319-329(1995).
-!- FUNCTION: Component of the cuticle of migratory locust which contains more than 100 different structural proteins.
-!- DOMAIN: The tetraseptide (A.A.P.-[AV]) repeats found throughout the protectin are also present in many proteins constituting the protective envelope of other species.
-!- MASS SPECTROMETRY: WM=13319.9; METHOD=Electrospray; RANGE=1-145;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gарв

    Eur. J. Biochem. 166:387-391(1987).
    -1- FUNCTION: Plant nonspecific lipid-transfer proteins transfer phospholipids as well as galactolipids across membranes. May play a role in wax or cutin deposition in the cell walls of expanding epidermal cells and certain secretory tissues.
    -1- SIMILARITY: Belongs to the plant LTP family.

                                                                                                                             Gaps

"Matrix Biol. 17:501-511(1998).

"I FUNCTION: Seems to specifically activate progelatinase A. May thus trigger invasion by tumor cells by activating progelatinase A on the tumor cell surface (By similarity). May play a role in the biomineralization of enamel and dentin.

"CATALYTIC ACTIVITY: Endopeptidase activity. Activates progelatinase A by cleavage of the propeptide at 37-Asn-|-Leu-38.

"COPALYTIC ACTIVITY: Endopeptidase activity. Activates progelatinase A by cleavage of the propeptide at 37-Asn-|-Leu-42 and 38-Gin-|-Inta-355 in the aggrecan interglobular domain.

"COPACTOR: Binds 1 zinc ion per subunit, calcium (By similarity).

"SUBLIABLIAR DOCATION: Type I membrane procein (Potential).

"SUBLIABLIY: Belongs to the peptidase MIOA family.

"SIMILARITY: Contains 1 hemopexin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright.             the tumor cell surface (By similarity).

-!- CATALYTIC ACTIVITY: Endopeptidase activity. Activates progelatinase A by cleavage of the propeptide at 37-Asn-|-Leu-38. Other bonds hydrolyzed include 35-GJy-|-Ile-36 in the propeptide of collagenase 3, and 341-Asn-|-Phe-342, 441-Asp-|-Leu-442 and 354-GIn-|-Thr-355 in the aggreean interglobular domain.
-!- COPACTOR: Binds 1 zinc ion per subunit, calclum (By similarity).
-!- SUBCELULAR LOCATION: Type I membrane protein (Potential).
-!- SIMILARITY: Belongs to the peptidase M10A family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   remogrant...txe.

The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bloavailability of the nucleic acid without interaction with a specific outer cell courface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is cuseful for delivering a nucleic acid to a cell in vivo, e.g. for gene cuseful for delivering a nucleic acid to a cell in vivo, e.g. for gene cerosis factor alpha. The complex is useful for manufacturing a necrosis factor alpha. The complex is useful for manufacturing a medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a targeting factor for lipid-nucleic acid complexes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                                                                                                                                                                    Lipid-nucleic acid complex; polycation; targeting factor; gene therapy; cancer; infection; immune deficiency; gene defect; genetic disease.

Membrane translocating peptide; MTLP; human; intracellular gene delivery; epithelial cell layer; gastrointestinal tract; circulatory system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition, useful for treating a pathological disease in an animal, comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a composition which comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 68; DB 8; Length 15; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a lipid-nucleic acid complex, comprising a not a protesting factor and a lipid, but not a protesting factor and a lipid, but not a protesting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                  Lipid-nucleic acid complex; polycation; targeting factor; gene therapy; cancer; infection; immune deficiency; gene defect; genetic disease; membrane translocating peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipidnucleic acid complexes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                      The sequence represents a human membrane translocated peptide (WTLP).

WILPS and their related fragments, morifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), eithor the directly or from a pharmaceutically active agent loaded particle, into the dircularcy system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the intracellular gene delivery, as a rapid screening method for the cidentification of MTLP which retain the functional activity of a MTLP, as a cell-based screen for assaying the functional activity of a MTLP and characterising the properties of a MTLP for diagnosis of a pathological disorder (by administration of a MTLP-active agent complex or or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                           Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and

The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mRNM is greater than in a non-Peyer's patch cell. The preferred protein of the
                                                                                                         compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention

localise the MTLP in a cell or tissue sample. MTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly of from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of MTLPs which retain the functional activity of a full-length MTLP, as a cell-based screen for assaying the functional activity of a full-length MTLP, and characterising the properties of a MTLP, for diagnosis of a pathological disorder (by administration of a MTLP, for diagnosis of a pathological disorder (by administration of a MTLP, agent complex or MTLP-active particle complex comprising a diagnostic agent) and for preventing or

invention is a transcription factor or a protein that activates a transcription factor selected from Jun-B, c-jun related TF, Jun-D, STAT 3 sugnal transducer and activator of transcription 3, Nfkappakoby; Tf pl05 subunit, S-myc proto-oncogene, myc related, Nm3-M2, uncleoside diphosphate kinase B, metastasis reducing protein, and C-est-I proto-oncogene, and p54. The preferred upregulated protein of the invention is selected from clusterin, T-cell surface glycoprotein CDS precursor, HSP 84, and Ca2+ dependent phospholipase A2 precursor and the mRNA is for a protein selected from the group. The method is useful for increasing or decreasing the level of a protein in a Peyer's patch cell, particularly in increasing antigen or vaccine delivery to M cells. The method may also be used to enhance transport of a drug through the gastrointestinal tract (GIT). This sequence represents a membrane translocating peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Membrane translocating peptide; MTLP; human; intracellular gene delivery; epithelial cell layer; gastrointestinal tract; circulatory system; targeting peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents a human membrane translocated peptide (MTLP). MTLPs and their related fragments, motifs, derivatives and analogues are used for enhanding uptake of a pharmacoutically active agent into a cell, into or out of an intracellular compartment and across a cell layer example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of MTLPs which retain the functional activity of a full-
                                                                                                                                                                                                     Human membrane translocating peptide (MTLP) #3.
                                                                                                AAU00634 standard, peptide; 19 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 2; Page 11; 42pp; English.

```

Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic

The sequence represents a human targeting peptide which is used to identify the presence of a human membrane translocated peptide (MTLP) and quantify the amount, to bind the MTLP to the surface of a particle, or to

Example 1; Page 22; 42pp; English.

of the peptides.

```
Composition, useful for treating a pathological disease in an animal, comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promoces absorption across epithelial ciells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention
                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mRNA is greater than in a non-Peyer's patch cell. The preferred protein of the invention is a transcription factor or a protein that activates a transcription factor or a protein that activates a transcription factor or a protein that activates a signal transducer and activator of transcription 3, NKappaabgr; Tf plo5 subunit, S-myc proto-oncogene, myc related, NM23-M2, nucleoside cubonit, S-myc proto-oncogene, myc related, NM23-M2, nucleoside cubonit, S-myc proto-oncogene, myc related, NM23-M2, nucleoside cubonit, and p54. The preferred upregulated protein of the invention is selected from clusterin, T-cell surface glycoprotein CD5 precursor, HSP cubonit selected from the group. The method is useful for increasing or decreasing the level of a protein in a Peyer's patch cell, particularly in increasing antigen or vaccine delivery to M cells. The method may also be used to enhance transport of a drug through the gastrointestinal tract invention.

Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
                                                               Membrane translocating peptide; MTLP; human; intracellular gene delivery; epithelial cell layer; gastrointestinal tract; circulatory system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents a human membrane translocated peptide (MTLP). MTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of MTLPs which retain the functional activity of a full-length MTLP, as a cell-based screen for assaying the functional activity of a MTLP and characterising the properties of a MTLP. for diagnosis of a pathological disorder (by administration of a MTLP-active agent complex or MTLP-active particle complex compressing a diagnostic agent) and for preventing or treating a pathological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peyer's patch cell; non-Peyer's patch cell; transcription factor; upregulated protein; antigen; vaccine delivery; M cell; membrane translocating peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 68; DB 4; Length 21; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a medicament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                                                                                                                                                                                               Lipid-nucleic acid complex; polycation; targeting factor; gene therapy; cancer; infection; immune deficiency; gene defect; genetic disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                 Amino acid seguence of membrane translocating peptide ZBlan094R.

```
Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a human membrane translocated peptide (MTLP). WILPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of MTLPs which retain the functional activity of a MTLP, as a cell-based screen for assaying the functional activity of a MTLP and characterising the properties of a MTLP. for diagnosis of a pathological disorder (by administration of a MTLP-active agent complex or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peyer's patch cell; non-Peyer's patch cell; transcription factor; upregulated protein; antigen; vaccine delivery; M cell; membrane translocating peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mRNA is greater than in a non-Peyer's patch cell. The preferred protein of the invention is a transcription factor or a protein that activates a transcription factor or a protein that activates a transcription factor of transcription 3. NKappabagis, Tf plos channel transducer and activator of transcription 3. NKappabagis, Tf plos cubunt, S-myc proto-oncogene, myc related, Nm23-M2, nucleoside diphosphate kinase B, metastasis reducing protein, and C-est-I proto-oncogene, and p54. The preferred upregulated protein of the invention is elected from clusterin, T-cell surface glycoprotein CDs precursor, HSP elected from the group. The method is useful for increasing or derreasing protein selected from the group. The method is useful for increasing or decreasing antigen or vaccine delivery to M cells. The method may also be used to enhance transport of a drug through the gastrointestinal tract (CIT). This sequence represents a membrane translocating peptide of the

The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mRNA is greater than in a non-Peyer's patch cell. The preferred protein of the transcription factor or a protein that activates a cranscription factor selected from Jun-B. c-jun related Try Jun-D, STAR 3 signal transducer and activator of transcription 3, Nfkappa&bgr; Tf plo5 subunit, S-myc proto-oncogene, myc related, Nm23-M2, nucleoside chiposphate kinase B, metestasis reducing protein, and C-est-I proto-oncogene, and p54. The preferred upregulated protein of the invention is selected from clusterin, T-cell surface glycoprotein CD5 precursor, HSP 84, and Ca2+ dependent phospholipase A2 precursor and the mRNA is for a protein selected from the group. The method is useful for increasing or decreasing the level of a protein in a Peyer's patch cell, particularly in increasing antigen or vaccine delivery to M cells. The method may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                             used to enhance transport of a drug through the gastrointestinal tract [T]. This sequence represents a membrane translocating peptide of the
              Increasing the levels of a protein in a Peyer's patch cell, useful for targeted vaccine or drug delivery, comprises delivering to the Peyer's patch cell a transcription factor or an activator of a transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                               translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention
Composition, useful for treating a pathological disease in an animal, comprises a transport peptide, ar extended peptide comprising the transport peptide or a transport-active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Composition, useful for treating a pathological disease in an animal, comprises a transport peptide, an extended peptide comprising the transport peptide or a transport-active
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition which comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acide of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects
                                                                                                                                                                                                                                                                                                                                                     Gaps

The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a medicament for trading or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a membrane translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention
                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                                                                                                                                                                                                                                                                             complex; polycation; targeting factor; gene therapy; immune deficiency; gene defect; genetic disease;
an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention

The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell card without interaction with a specific outer cell card explain the mucleic acid without interaction with a specific outer cell card explain the manual less than 400 nm. The lipid-nucleic acid complex is greater therapy. It reduces levels of inflammatory cytokines such as tumour cherapy. It reduces levels of inflammatory cytokines such as tumour cardicament for treating or inflammatory cytokines such as tumour corrosis factor-alpha. The complex is useful for manufacturing a concerplation or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited genetic diseases). The present sequence represents a targeting factor for lipid-nucleic acid complexes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
Lipid-nucleic acid complex useful for delivering a nucleic acid to a cell, comprises compacted nucleic acid, polycation, targeting factor and lipid, and does not comprise protamine or its salt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 127.
                                                                                                                                                                                                                                                                                                                                                                                        Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          signal sequence MST (membrane-translocating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating cequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                          Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 123.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 131.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells.                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates extostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi PGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 128.
                                                                                                                                                                                                           Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                       (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C35 epitope; cytostatic; vaccine; tumour; breast; bladder carcinoma; human; Kaposi PGF signal sequence h region MST; cell-penetrating; fibroblast growth factor; membrane-translocating signal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

New peptidomimetic compounds are tumor cell replication inhibitors useful to treat tumors or oncological disorders of e.g. breast, kidney, mouth, larynx, esophagus, stomach, testis, cervix, head, neck, colon, ovary, lung, bladder and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to peptidomimetic compounds and their salts. The compound is useful in the treatment of a tumnour or an oncological disorder (breast, kidney, mouth, larynx, oesophagus, stomach, testis, cervix, head, neck, colon, ovary, lung, bladder, skin, muscle, pancreas, prostate, bone, eye, blood cells or brain cancers) in a human or animal. The present sequence represents is a peptide comprising a membrane translocating sequence.
                                                                                                                                                                                                                                                                   peptidomimetic; Cytostatic; Tumour; Apoptosis; oncological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptidomimetic; Cytostatic; Tumour; Apoptosis; oncological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         83.8%; Score 57; DB 8; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 132.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.

The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                         Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopee.                                                                                                                                                                                                                                                                                                                             New peptidomimetic compounds are tumor cell replication inhibitors useful to treat tumors or oncological disorders of e.g. breast, kidney, mouth, larynx, esophagus, stomach, testis, cervix, head, neck, colon, ovary, lung, bladder and skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to peptidomimetic compounds and their salts. The compound is useful in the treatment of a tumour or an oncological disorder (breast, kidney, mouth, larynx, oesophagus, stomach, testis, cervix, head, neck, colon, ovary, lung, bladder, skin, muscle, panortess, prostate, bone, eye, blood cells or brain cancers) in a human or animal. The present sequence represents is a peptide comprising a membrane translocating sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 43.

                                                                                                                                                    ö
antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates evicetatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                    Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 3.

The invention relates to a novel isolated polypeptide comprising or consisting of two or more C35 peptide epitopes. The polypeptide of the invention demonstrates cytostatic activity and may be useful for the formulation of an immunogenic composition, such as a vaccine, to induce antibodies and cell-mediated immunity against target cells such as tumour cells. Furthermore, the polypeptide and its analogues may be useful as prognostic markers for carcinoma, such as human breast or bladder carcinoma. The current sequence is that of human C35 / Kaposi FGF (fibroblast growth factor) signal sequence MST (membrane-translocating sequence) cell-penetrating polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel C35 polypeptide useful for formulation of immunogenic composition to induce antibodies and cell-mediated immunity against tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Human C35 / Kaposi FGF signal sequence MST cell-penetrating peptide 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             C35 epitope; cytostatic; vaccine; tumour; breast; bladder carcinoma; human; Kaposi FGF signal sequence h region MST; cell-penetrating; fibroblast growth factor; membrane-translocating signal.

The specification describes a fusion protein for regulating normal or infected cell function, comprising an antibody conjugated to a peptide having immunostimulatory, membrane transport, and homophilic activities. The antibody is immunospecific for a signaling protein internal cell consisting of caspases, kinases or phospharases, an immature viral protein, a cell-surface or intracellular tumour antigen, a nuclear or nucleolar protein participating in regulation of DNA synthesis and gene expression, or a cytoskeletal protein participating in cell proliferation or cytostasis. The peptide portion of the fusion protein is preferably a membrane transporter peptide that is endogenous to Kaposi fibroblast factor, TAT peptides of HIV-1, antennapedia homeodomain-derived peptide, herpes virus protein VP22, or transportan peptide. Fusion protein of the preventing human diseases, e.g., Alzheimer's diseases, Huntington's disease or Parkinson's disease. CG membrane transporter peptide which is derived from Kaposi fibroblast con proteins of the content of the factor. The peptide is used to produce fusion proteins of the

Kohler H, Morgan AC;

Treating patient suffering from debilitating or life threatening disease such as malignancy, by administering autophilic antibody capable of binding to cellular receptors to promote target cell apoptosis, to WPI; 2004-676149/66

Example 2; SEQ ID NO 2; 9pp; English.

patient

The invention relates to treating a patient suffering from a debilitating or life threatening disease, involving administring at least one sutophilic antibody to the patient in an amount effective to alleviate symptoms of the disease. An autophilic antibody is a non-covalent, dimerisation. Also included by the attachment of a peptide which induces dimerisation. Also included are potentiating apoptosis of selected cells of antibody period administering to the patient first autophilic antibody period administering to the patient of treat autophilic antibody period administering techniques (where the autophilic antibody by charging administering the autophilic antibody by contains a T15 autophilic peptide sequence appearing an autophilic antibody by contains a T15 autophilic peptide sequence that further potentiates the ability of the modified out autophilic oppide sequence that further potentiates the ability of the modified auto antibody to crosslink once bound to a target antigen relative to the unmodified auto antibody, formulating an autophilic antibody composition of salt concentrations of to.8M or more, low levels of sodium dodecyl or peptide sequence or miligate dimerisation in solution (comprising addition of salt concentrations of the antibody to ataget antibody considered or modifications of the antibody of antibody to severe or modifications of the antibody of antipody and antibody confider (supplied say of an antibody and antibody and antibody confiders (involving administering the autophilic antibody to severe combined immuno deficiency (SCID) or nude mice having human tumour combined immuno deficiency (SCID) or nude mice having human tumour combined immuno deficiency (SCID) or nude mice having one or more conservative subshilic coupling peptides seach having one or more conservative subshility peptides are conjugated to different selfenting from a debilitating or a template peptide, and comparing self-binding properies egence of template peptide, or these new conservative peptides are conjugated to entry into the target cell

The invention relates to the use of the MTS peptides for pereing fusion proteins which can be used for the production of polypeptides of interest such as Schistosoma japonicum glutathion of transferase, an adenovirus E3 19K protein or a mammalian p53 protein. Fusions of the peptides can also be used for inducing an immune response in a mammal using e.g. a viral polypeptide such as hepatitis B surface antigen. They can also be used for protecting a subject from an infectious agent using a polypeptide that inhibits reproduction of the infectious agent such as a protease inhibitor. They can also be used for treating cancer using a polypeptide thus suppressor such as p53 protein or a polypeptide inhibitor of B61-2. The methods can be used for treating canine, feline and bovine diseases and also for studying intracellular
                                                                                                                                                                                                                                                                                                                    Membrane-translocating peptide sequence; MTS; fusion protein; production; Schistosoma japonicum; glutathione S transferase; adenovirus; mammal; p53; immune response; hepatitis B virus; surface antigen; canine; feline; protease inhibitor; cancer; tumor suppressor; bovine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New peptides containing a membrane-translocating sequence used to develop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a polypeptide comprising at least two peptide monomers, in which each peptide monomer comprises an amino acid sequence which serves as a nuclear localisation sequence (NLS) or an amino acid sequence which serves as a protein transduction domain (PTD) in eukaryotic cells. The polypeptide of the invention is used for transferring a molecule into eukaryotic cells. The use of a polypeptide comprising NLS or PTD drastically increases the efficiency of the transfer of attached molecules, preferably negatively charged molecules into the nucleus or cytoplasm of a eukaryotic cell. The present sequence is hydrophobic PTD which include the sequence of transportan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polypeptides comprising at least two monomers which comprise a nuclear localization sequence and protein transduction domain, respectively useful for transferring nucleic acid molecules into eukaryotic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a composition (I) comprising an immune effector cell and a cell penetrating peptide (CPP) associated with an antigen or antibody. Also included are (I) a vaccine comprising (I). CPP associated with an antigen, and a pharmaceutically acceptable carrier and (2) preparing a composition for a disease, by providing (I) and CPP associated with an antigen for disease, and introducing the antigens associated with an antigen for disease, and introducing the antigens are, for example, tumour antigen derived epitopes recognised by tumour infiltrating lymphocytes (TIL) of HLA (human leukocyte antigen) class I or II. The composition is useful for enhancing immunity in an animal to a disease, by administering a mature dendritic cell comprising CPP associated with an antigen to disease, to the animal, such that following comprises both CD4+ and CD8+ T cells. It is also useful for treating a disease (e.g. cancer, tumour, melanoma, thymoma, lymphoma, sarcoma, lung cancer, non-Hodgkin's lymphoma, leukaemia, Hodgkin's lymphoma, accomer, cervical cancer, bladder cancer and pancreatic cancer). The animal is further subjected to a cancer reatment including surgery, radiation, chemotherapy or gene therapy. The administration of (I), cancer is a concer treatment. The present sequence is cell penetrating peptide of the cancer treatment. The present sequence is cell penetrating peptide of
                                                                                                                                                                                                                                                                                                                                   Novel composition for treating a disease in an animal, comprises an immune effector cell and cell penetrating peptide associated with an antigen or antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Membrane translocation signal; signal sequence based peptide I; red blood cell vehicle; polypeptide delivery; Grb2; SH2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   79.4%; Score 54; DB 5; Length 12; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compositions for enhancing uptake of e.g. drugs or DNA across a cell
membrane, comprise membrane translocating peptides having specific amino
acid sequences or a derivative, fragment, motif, analog or peptidomimetic
of the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents a human membrane translocated peptide (MTLP). MTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the indentification of MTLPs which retain the functional activity of a full-length MTLP, as a cell-based screen for assaying the functional activity of a MTLP and characterising the properties of a MTLP, for diagnosis of a phenlogical disorder (by administration of a MTLP-active agent complex arms.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cell penetrating peptide; cancer; tumour; melanoma; thymoma; lymphoma; sarcoma; lung cancer; non-Hodgkin's lymphoma; leukaemia; Hodgkin's lymphoma; uterine cancer; cervical cancer; bladder cancer; kidney cancer; adenocarcinoma; breast cancer; prostate cancer; ovarian cancer; pancreatic cancer; vaccine; dendritic cell; tumour infiltrating lymphocyte; TIL; human leukocyte antigen; HLA;

dysfunctions of the gastrointestinal tract or liver, comprises cystic fibrosis transmembrane conductance regulator and a membrane translocation sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Translocation; delivery vehicle; agent-membrane translocation sequence; MTS; membrane translocation sequence; plasma membrane; red blood cell; immunisation; antigen; intracellular delivery; therapeutic; HIV-1; trans-activating protein; Tat; Antennapedia homeodomain protein; Antp-HD; VP22 protein; HSV-VP22; signal-sequence-based peptide; Tranportan; Amphiphilic model peptide; Grb2 SH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a method for preparing a delivery vehicle for delivering an agent to a target site in a vertebrate. The method comprises loading a cell with an agent-membrane translocation sequence (MTS) conjugate, which contains a membrane translocation sequence enabling the agent to crose the plasma membrane of a cell. Also disclosed is a pharmaceutical composition comprising a red blood cell for delivery
                                                                                                                                            The invention relates to a novel fusion protein comprising a cystic fibrosis transmembrane conductance regulator (CFTR) and a membrane translocation sequence (WTS). The sequence represents the membrane translocation sequence. The fusion protein of the invention has gastrointestinal, respiratory, and hepatotropic activity. The protein is taken up by affected cells and thereby used for treating cystic fibrosis or dysfunctions of the gastrointestinal tract or liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preparing a red blood cell vehicle suitable for delivering an agent to target site in a vertebrate due to loading the red blood cell with an
                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method of preparing a red blood cell vehicle suitable for delivering an agent to a target site in a vertebrate comprising providing a red blood cell and loading the red blood cell with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cystic fibrosis; transmembrane conductance regulator; CFTR; membrane; translocation sequence; MTS; gastrointestinal; respiratory; hepatotropic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               an agent-MTS (membrane translocation sequence) conjugate. The red blood cells produced may be used in the preparation of a medicament for delivery of an agent to or at a target site and of one or more agents to a vertebrate. The agent is actively released from the red blood cell vehicle by application of a stimulus to disrupt the red blood cell vehicle. This sequence represents signal sequence derived from the Grb2 SH2 domain, one of the membrane translocation peptides tested in the
                                                                                                                                                                                                                                                                                                                                            Preparing a red blood cell vehicle suitable for delivering an agent to target site in a vertebrate due to loading the red blood cell with an agent-membrane translocation sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

ö
of an agent to a vertebrate, the red blood cell comprising the novel agent-MTS conjugate and a method of immunisation of an animal with an antigen. The method is useful for preparing delivery vehicles, particularly a red blood cell, for the intracellular delivery of a therapeutic agent to a target site. The method is particularly useful for selectively releasing the agent-MTS conjugate at a target cell, and for selectively releasing the agent by the cells at target site. The preferred MTS sequences are from HIV-1 trans-activating protein (Tat), Drosophila Antennapedia homeodomain protein (Antp-HD), Harpes Simplex-1 virus VP22 protein (HSV-VP22), a signal-sequence-based peptide and a Tranportan and Amphiphilc model peptide. The sequence presenced is the signal-sequence based peptide III, which is derived from the Grbz SH2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to delivering an agent to a target site in a vertebrate. The method involves (a) loading a red blood cell (RBC) with a virus or a virus-like particle (I) comprishing an agent; (b) sensitizing RBC to render it more susceptible to disruption than unsensitized RBC; (c) introducing RBC into a vertebrate, and (d) applying energy to release (I). Steps (a) and (b) may be performed in any order. (II) (RBC loaded with a virus or a virus-like particle comprising a therapeutic agent) is useful for the delivery of a therapeutic agent to a target site in a vertebrate, or in the preparation of a medicament for delivery of a therapeutic agent to a target site in a vertebrate. (II) is also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Delivering agent to target site in vertebrate comprises loading red blood cell with virus or virus-like particle comprising agent, sensitizing cell, introducing cell into vertebrate and applying energy to release virus particle from cell.
                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Red blood cell; RBC; virus; vertebrate; therapeutic; tissue imaging;

The fusion protein comprises a first polypeptide comprising at least one intercellular transport polypeptide and second polypeptide compression at least one antigenic polypeptide or peptide. The invention also describes an optional linker peptide linking the first and second polypeptide. The nucleic acid is useful as a vaccine for enhancing immune responses, primarily cytotoxic T lymphocyte responses to specific antigens such as tumour or viral antigens. The compositions comprising the nucleic acids are especially useful as a therapeutic vaccine for cancer and for major chronic viral infections, including equine or bovine herpesvirus, marek's disease virus in chickens and other fowls, animal retroviral diseases, pseudorabies and rabies. The present amino
for delivering one or more agents to a vertebrate and for treating or preventing a disease. The method is useful for delivering agents such as those useful for imaging of tissues in vivo or ex vivo, preferably for delivering an agent to a subcellular on a subcellular and a subcellular a su
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Virucide; cytostatic; vaccine; intercellular transport; antigenic; immune response; cytotoxic T lymphocyte; tumour; cancer; pcDNA3-E7/MTS; chronic viral infection; veterinary herpesvirus infection; pseudorabies; equine herpesvirus; bovine herpesvirus; Marek's disease virus; chicken; fowl; animal retroviral disease; rabies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acids encoding fusion polypeptide comprising intercellular transport polypeptide linked to antigenic polypeptide, useful as therapeutic vaccine for cancer and major chronic viral infections.

The transport agent region is able to facilitate the uptake of the active agent region. The transport into a cell. The active agent region is an active therapeutic agent region able to facilitate axon growth and an analogue. The drug delivery construct is useful for suppressing the inhibition of neuronal axon growth, facilitating axon growth, treating nerve injury, treating ischammic damage related to stroke injury. The drug delivery construct and the drug conjugate are useful for the manufacture of a pharmaceutical composition for treating nerve injury. The invention is useful in gene therapy. The present sequence is transport peptide used in the invention
acid sequence represents the peptide used in the methods of the invention for the generation of pcDNA3-E7/MTS expression vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a new drug delivery construct comprises at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New drug delivery construct comprising a transport and active agent region, useful for the manufacture of a pharmaceutical composition for treating nerve injury.
                                                                                                                                                                                                                                                                                                                                                                                                           Drug delivery construct; axon growth; nerve injury; ischaemic damage; stroke injury; gene therapy; neuroleptic; neuroprotective.
                                                                                                                     Gaps
                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             79.4%; Score 54; DB 6; Length 12; 100.0%; Pred. The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mRNA is greater than in a non-Peyer's patch cell. The preferred protein of the invention is a transcription factor or a protein that activates a transcription factor or a protein that activates a transcription factor or a protein that activates a transcription factor selected from Jun-B, c-jun related TF, Jun-D, STAT 3 caignal transducer and activator of transcription 3, Nfkappa&bgr; Tf plos subunit, S-myc proto-oncogene, myc related, Nm3-M2, nucleoside ciphosphate kinase B, metastasis reducing protein, and C-est-I proto-oncogene, and p54. The preferred upregulated protein, of the invention is selected from clusterin T-cell surface glycoprotein CDS precursor, HSP 84, and Ca2+ dependent phospholipase A2 precursor and the mRNA is for a protein selected from the group. The method is useful for increasing or decreasing the level of a protein in a Peyer's patch cell, particularly in increasing antigen or vaccine delivery to M cells. The method may also be used to enhance transport of a drug through the gastrointestinal tract (GIT). This sequence represents a membrane translocating peptide of the

The present invention describes a recombinant fusion protein (I) for detecting binding of a molecule of interest. (I) comprises: (a) a detection domain, (b) a first localisation domain, the first constituting the molecule of interest. The detecting domain, the first constituting the recombinant fusion protein for the molecule of interest are operably linked. The binding domain for the molecule of interest are operably linked. The binding domain for the molecule of interest is separated from the first localisation domain by 0 constituting the molecule of interest is separated from the first localisation domain by 0 constituting the molecule of interest both do not occur in a single non-recombinant protein with the same spacing as in the recombinant fusion protein with the same spacing as in the recombinant fusion protein with the same spacing as in the recombinant fusion protein with the same spacing as in the recombinant fusion protein.

(2) a recombinant expression vector comprising the nucleic acid control sequences operably linked to the recombinant the recombinant control sequences operably linked to the recombinant fusion protein.

(2) a recombinant action call encoding the recombinant fusion protein of interest; and (5) a method for identifying compounds that alter the binding of the molecule of interest. The recombinant fusion protein is useful for detecting binding of a molecule of interest. The recombinant fusion of fusion protein and enables the monitoring of biochemical events in live, inteat the process of interest is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New recombinant fusion protein comprising detection and first localization domains and a binding domain for the molecule of interest, useful for detecting binding of a molecule of interest.

molecule into cells or mucles, comprising a cold shock domain, its homologue and functional derivative, and a membrane translocation sequence or its functional derivative, and a membrane translocation sequence or its functional derivative, and a membrane translocation sequence or its functional depty septides and/or derivatives. The functional comprises a cold shock domain, eukaryotic Y-box proteins, DNA Cobb protein is modified by inserting into the cold shock protein is modified by inserting into the cold shock protein is modified by inserting into the cold shock protein is selected from DNA condensation domain. The DNA condensation domain is selected from DNA condensation or binding domain is selected from DNA condensation domain. The CNA condensation or binding domain is selected from DNA condensation domain. The DNA condensation domain (SPRR) 3-4 and the positive charge nuclear localisation sequences (MIS+). The membrane fusion sequence is protein transduction domain (PPD) or membrane fusion sequence selected from HA, GST, and His6 tag. The fusion protein is useful for delivering nucleic acids to an embryo or cells for gene delivery, or for delivering nucleic acids to an embryo or to a living animal for the production of transgenic animal. This is the amino acid sequence of a membrane fusion sequence derived from Kaposi's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
The invention describes a fusion protein for delivery of a desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel polypeptide comprising a heat shock protein 20-derived polypeptide. A polypeptide of the invention has cyfosteratic, antiarteriosclerocite, vasotropic, antianginal, cerebroprotective, antiarchythmic, antiatehmatic, gynaecological, cerebroprotective, antiarchythmic, antiatehmatic, gynaecological, hypotensive, antimigraine, tocolytic, and relaxant activity, and may act as a HRSP agonist or antagonist. The polypeptides, heat shock protein (HSP) 20, and methods are useful for treating or preventing a disorder, e.g. intimal hyperplasia, stenosis, restenosis, transplant vasculopathy, atherosclerosis, smooth muscle cell tumours such as leiomyosarcoma, or vasospasm, which is associated with angina, coronary vasospasm, britanetal's angina, coronary ischeamia, stroke, bradycardia, hypertension, pulmonary (lung) hypertension, asthma (bronchospasm), coronary pre-eclampsia/eclampsia/eclampsia/s Raynaud's phenomenon, haemolytic-uremia, non-occlusive mesenteric ischaemia, anal fissure, achalasia, impotence, migraine, or polypeptides and HSP 20 are also useful for inhibiting smooth muscle cell proliferation and/or migration. The present sequence represents a peptide used in a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New heat shock protein 20-derived polypeptides, useful for inhibiting, treating or preventing smooth muscle cell vasospasm or a disorder such as intimal hyperplasia, restenosis, atherosclerosis or smooth muscle cell
                                                                                                           antianginal; cerebroprotective; antiarrhythmic; antiasthmatic; gynaecological; hypotensive; antimigraine; tocolytic; relaxant; HSP; smooth muscle cell; smooth muscle cell; transduction domain.
                                                                                           shock protein 20; cytostatic; antiarteriosclerotic; vasotropic;
                                                              Transduction domain peptide of the invention SEQ ID NO:286.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Lokesh J;

The invention relates to a novel fusion protein for delivery of a desired molecule into cells or nuclei comprising a cold shock domain, its homologue and functional derivative and a membrane translocation sequence or its functionally equivalent peptides and/or derivatives. The fusion protein of the invention may be useful for delivering DNAs and RNAs to in vivo cells for gene therapy or for delivering nucleic acids to an embryo or to a living animal for the production of transgenic animals. The current sequence is that of a membrane fusion sequence peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 fusion protein; site-specific DNA recombinase domain;

                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                  셤
                                                                                                                                                                                                                                This invention relates to a novel fusion protein comprising a site-specific DNA recombinase domain and a domain containing a modified nuclear localisation signal (NLS) of type one having 5-10 amino acid residues and containing at least 5 basic amino acid residues and containing at least 5 basic amino acid residues and no Proresidue. The fusion protein is useful for preparing an agent for inducing target gene alterations in living organisms or in cell cultures, where the living organisms or cells of the cell cultures carry at least one or more recognition sites for the site-specific DNA recombinase integrated in its genome. The modified NLS is useful for enhancing cellular uptake of functional biopolymers in living organisms or cell cultures. The present sequence is that of a Karposi fibroblast growth factor peptide invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytoplasmic transduction peptide; cell membrane transduction potential; cell membrane transduction; cytotoxic T lymphocyte; drug delivery system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
```

```
The present invention describes a cytoplasmic transduction peptide which has cell membrane transduction potential, where a cell is treated with the cytoplasmic transduction peptide for a period of time and then treated with a protease, a cell membrane transduction by the cytoplasmic transduction peptide continues to occur, and the cytoplasmic transduction membrane for cell. Also described: (1) a mucleic acid molecule encoding the cytoplasmic transduction peptide (2) a cytoplasmic transduction system comprising the cytoplasmic transduction peptide and a biologically active molecule covalently linked to the peptide; and (3) a method for delivering the biologically active molecule into the cytoplasm of a cell. The cytoplasmic transduction peptide is useful in inducing cytotoxic T lymphocytes and a drug delivery system targeting cytoplasm. The present sequence is used in the exemplification of the present
New cytoplasmic transduction peptide having a characterized cell membrane in the transduction potential, useful for inducing cytotoxic {\tt T} lymphocytes and a drug delivery system targeting cytoplasm.
                                                                                                                                                                                                                                                                            Example 1; Page 21; 77pp; English.

The sequence represents a human membrane translocated peptide (WTLP).

WTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), cith the directly or from a pharmaceutically active agent loaded particle, into the dirculatory spatem of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of WTLPs which retain the functional activity of a fullength WTLP, as a cell-based screen for assaying the functional activity of a MTLP and characterising the properties of a MTLP, for diagnosis of a pathological disorder (by administration of a WTLP-active agent complex or mTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
 Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
 Membrane translocating peptide; MTLP; human; intracellular gene delivery; epithelial cell layer; gastrointestinal tract; circulatory system.

The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mana. Is a nucleic acid coding for a protein, the level of which or its mana. Is greater than in a non-Peyer's patch cell. The preferred protein of the invention is a transcription factor or a protein that activates a transcription factor selected from Jun-B, c-jun related TF, Jun-D, STAT 3 companal transducer and activator of transcription 3, NKappasbapri Tf plos subunit, S-myc proto-oncogene, myc related, NM2-M2, nucleoside diphosphate kinase B, metastasis reducing protein, and C-est-I protocomocogene, and psy. The preferred upregulated protein of the invention is selected from clusterin, T-cell surface glycoprotein CD5 precursor, HSP concepted from the group. The method is useful for increasing or protein selected from the group. The method is useful for increasing or decreasing antigen or vaccine delivery to M cells. The method may also be used to enhance transport of a drug through the gastrointestinal tract function is a membrane translocating peptide of the

The present invention relates to a composition which comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention
 comprises a translocating peptide, consisting of a transport peptide, an
extended peptide comprising the transport peptide or a transport-active

 The invention provides a composition comprising an isolated polypeptide (I) (polypeptide inhibitor of a cellular protein nuclear translocation) which comprises a signal sequence peptide capable of delivering (I) through a cytoplasmic membrane into the cell; and a nuclear localization signal sequence (NLS) present along with an immunosuppressant. (I) or its derivatives provide useful tools for introducing an exogenous polypeptide comprising an NLS into an intact cell to inhibit nuclear translocation of a cellular protein, for studying the role of nuclear translocation in the regulation of cellular processes. See AAYSS812 for detailed uses of (I) and compositions containing (I). The present sequence represents a polypeptide fragment comprising the hydrophobic region of the signal peptide from fibroblast growth factor and the SV40 large T antigen NLS
 Novel composition comprising a nuclear localization signal and an inhibitor of nuclear translocation, useful for preventing transplanted

 The present sequence represents the SV40MEM polypeptide, which comprises the hydrophobic region of the signal peptide from fibroblast growth active and the SV40 large antigen nuclear localsation signal (NLS). The gator and the SV40 large antigen nuclear localsation signal (NLS). The peptide has immunosuppressive activity, and causes an approximately 75-SV40 inhibition of kappa immunoglobulin (19) light chain expression in cresponse to S. typhosa LPS. L. and D-forms of the SV40MEM peptide are equally effective. The SV40MEM polypeptide exemplifies the nuclear translocation inhibitor polypeptide of the invention. Nuclear CC translocation inhibitor polypeptide comprise a signal sequence peptide capable of delivering the polypeptide through the cytoplasmic membrane into a cell, and at least 2 nuclear localisation sequences (NLSS). The COLYPEPTIGE capable of delivering the polypeptide through the cytoplasmic membrane copyplicates can be used to inhibit nuclear translocation of certain cellular protein. In-addition, since the nuclear translocation of certain cellular computed inhibitors are useful as immunosuppression agents. The colypeptides can therefore be usef for the treatment of immune disorders including autoimmune diseases. The polypeptides can also be used for the treatment of sepsis and in thiste a state of hypersensitivity, for the treatment of sepsis and in the prevention of septic shock, antiviral agents, tumour growth

The invention provides a composition comprising an isolated polypeptide (I) (polypeptide inhibitor of a cellular protein nuclear translocation)

which comprises a signal sequence poptide capable of delivering (I) through a cytoplasmic membrane into the cell; and a nuclear localization signal sequence (NLS) present along with an immunosuppressant. (I) or its derivatives provide useful tools for introducing an exogenous polypeptide comprising an NLS into an intact cell to inhibit nuclear translocation of a cellular protesin, for studying the role of nuclear translocation in the cregulation of cellular processee. (I) along with other immunosuppressants are useful as immunosuppression compositions, used for preventing or tissue in a subject, preferably mammals. Administration of antiviral amounts of the composition into a subject is useful for treating or preventing a viral infection. The composition also is useful in the treatment of a wide variety of immune disorders such as rheumatoid arthritis, multiple sclerosis, juvanile-onset diabetes, systemic lupus crytematosus (SLB), autoimmune uveoretinitis, autoimmune oophoritis, cron's disease, sarcoidosis, rheumatic carditis, antoimmune oophoritis, Cron's disease, sarcoidosis, rheumatic or organs. They are also useful for treating physical symptoms include actime or organs. They are also useful for treating physical symptoms manifested by response to allergens which can initiate a state of hypersensitivity, or which can provoke a hypersensitivity reaction of transplanted tissue or organs. They are also useful for treating physical symptoms include asthma, joint swelling and urticaria. Additionally, due to the superior immunosuppressive treatment of sepsis and in the prevention of septic shock. They are also used as antiviral agents and also can be used to suppress tumor growth. Immune suppression than either treatment alone. The composition contact the composition of treatment alone. The composition contact the composition of the prevention of the prevention of treatm

The specification describes a lipid-nucleic acid complex, comprising a compacted nucleic acid, a polycation, a targeting factor and a lipid, but not a protamine. The targeting factor increases cellular bioavailability of the nucleic acid without interaction with a specific outer cell surface membrane receptor. The mean diameter of the complex is greater than 100 nm and less than 400 nm. The lipid-nucleic acid complex is useful for delivering a nucleic acid to a cell in vivo, e.g. for gene therapy. It reduces levels of inflammatory cytokines such as tumour necrosis factor-alpha. The complex is useful for manufacturing a neciosament for treating or diagnosing a variety of diseases, conditions or syndromes such as cancer, bacterial, viral or parasitic infections, immune deficiencies, gene defects, and gene deficiencies (e.g. inherited translocating peptide, which is used as the targeting factor in lipid-nucleic acid complexes of the invention

 Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic
 The sequence represents a human membrane translocated peptide (WTLP). WTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method is useful for intracellular gene delivery, as a rapid screening method for the dentification of MTLPs which retain the functional activity of a MTLP, as a cell-based screen for assaying the functional activity of a MTLP, and characterising the properties of a MTLP, for diagnosis of a pathological disorder (by administration of a MTLP-active agent complex or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder.

Claim 1; Page 24; Opp; English.

The present invention relates to a composition which comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells lining the GIT. The present sequence is a polypeptide used in the exemplification of the invention

The sequence represents a human targeting peptide which is used to identify the presence of a human membrane translocated peptide (WTLP) and quantify the amount, to bind the WTLP to the surface of a particle, or to localise the WTLP in a cell or tissue sample. WTLPs and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of an animal. This method for the identification of WTLPs which retain the functional activity of a full-length WTLP, as a cell-based screen for assaying the functional activity of a MTLP, as a characterising the properties of a MTLP, for diagnosis of a pathological disorder. (by administration of a MTLP, for diagnosis of a pathological disorder particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder.

 Composition, useful for treating a pathological disease in an animal, comprises a translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active
 The present invention relates to a composition which comprises a transport peptide, an extended translocating peptide, consisting of a transport peptide, an extended peptide comprising the transport peptide or a transport-active fragment of at least 4 amino acids of the transport peptide. The composition is useful in treating a pathological disorder in an animal, as it protects an orally delivered active agent from enzymatic degradation in the gastrointestinal tract (GIT), and promotes absorption across epithelial cells liming the GIT. The present sequence is a polypeptide used in the

The present invention describes a cell permeable peptide comprising at least the hydrophobic core of a signal peptide (or analogue) containing at least that additional positively charged amino acid (or analogue). The peptides are useful for the intracellular delivery of molecules, especially peptide nucleic acids to in vivo targets. The peptides are useful in commercial drug-delivery systems, in e.g. gene therapy, cancer therapy and anti-infectious agent therapy. The peptides facilitate biochemical and molecular biological research. The modified peptides facilitate intracellular delivery of any cell-impermeable substances and improve delivery into low permeablity calls. Delivery into sub-compartments can be achieved by modifying the signal peptides. The present sequence represents a peptide used in the exemplification of the

The invention relates to a novel method for increasing the levels of a protein in a Peyer's patch cell. The method comprises delivering to the cell a nucleic acid coding for a protein, the level of which or its mana is greater than in a non-Peyer's patch cell. The preferred protein of the invention is a transcription factor or a protein that activates a transcription factor selected from Jun-B, c-jun related TF, Jun-D, STAT 3 -signal transducer and activator of transcription 3, NKtappakbgr; Tf plo5 subunit, S-myc proto-oncogene, myc related, Nm23-M2, nucleoside diphosphate kinase B, metagrasis reducing protein, and C-est-I proto-oncogene, and p54. The preferred upregulated protein of the invention is selected from clusterin, T-cell surface 9lycoprotein CD5 precursor, HSP selected from clusterin, T-cell surface 9lycoprotein CD5 precursor, HSP selected from the group. The method is useful for increasing or decreasing the level of a protein in a Peyer's patch cell, particularly in increasing antigen or vaccine delivery to M cells. The method may also
 ö
 intracellular gene delivery, as a rapid screening method for the dentification of MTLPs which retain the functional activity of a full-length MTLP, as a cell-based screen for assaying the functional activity of a MTLP, and characterising the properties of a MTLP, for diagnosis of a pathological disorder (by administration of a MTLP-active agent complex or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
 Increasing the levels of a protein in a Peyer's patch cell, useful for targeted vaccine or drug delivery, comprises delivering to the Peyer's patch cell a transcription factor or an activator of a transcription

The sequence represents a human membrane translocated peptide (WTLP).

WILPS and their related fragments, motifs, derivatives and analogues are used for enhancing uptake of a pharmaceutically active agent into a cell, into or out of an intracellular compartment and across a cell layer (for example, an epithelial cell layer lining the gastrointestinal tract), either directly or from a pharmaceutically active agent loaded particle, into the circulatory system of a naimal. This method is useful for intracellular gene delivery, as a rapid screening method for the identification of WTLPs which retain the functional activity of a full-length MTLP, as a cell-based screen for assaying the functional activity of a pathological disorder (by administration of a WTLP-active agent complex or MTLP-active particle complex comprising a diagnostic agent) and for preventing or treating a pathological disorder
 Compositions for enhancing uptake of e.g. drugs or DNA across a cell membrane, comprise membrane translocating peptides having specific amino acid sequences or a derivative, fragment, motif, analog or peptidomimetic

the nuclear localisation domain of fibroblast growth factor flanked by the nuclear localisation domain of fibroblast growth factor flanked by the nuclear localisation signal (NLS) from the HIV-1 matrix protein. The immunosuppressive activity of this peptide was compared with that of the cytopher compared with that of the sydomEm polypeptide causes of the SydomEm polypeptide causes of the SydomEm polypeptide causes of the SydomEm polypeptide are equally effective. The SydomEm polypeptide exemplifies the complast translocation inhibitor polypeptide of the invention. Nuclear translocation inhibitor polypeptide through the cytoplasmic membrane control capable of delivering the polypeptide through the cytoplasmic membrane into a cell, and at least 2 nuclear translocation of certain cellular protein. In addition, since the nuclear translocation of certain cellular complypeptides can be used to inhibit nuclear translocation of certain cellular complypeptide inhibitors are useful as immunosuppression agents. The polypeptides can therefore be used for the treatment of immune diseases. The polypeptides can also be used for treating physical symptoms manifested by responses to allergens which can intitate a state of hypersensitivity, for the treatment of sepsis and in the prevention of septic shock, antiviral agents, tumour growth culturar genes
 ö
 Nuclear translocation inhibitor polypeptides - comprising signal sequence for delivery through the cytoplasmic membrane and at least 2 nuclear
 The present sequence represents the HIV-IMEM polypeptide, which comprises
 SV40NEW polypeptide; signal peptide; fibroblast growth factor; 3400 large antigen; nuclear localisation signal; NLS; ambages antigen; nuclear localisation signal; NLS; simmunosuppressive activity; inhibition; nuclear translocation inhibitor; kappa immunoglobulin light chain expression; S. typhosa LPS; nuclear translocation; treatment; immune disorder; autoimmune disease; hypersenstivity; sepsis; prevention; septic shock; antiviral agent; tumour growth suppressor; HIV-IMEM.
 Gaps
 HIV-IMEM polypeptide used to inhibit kappa-Ig light chain expression.

 Bacteriol. 183:5110-5121(2001).
--- FUNCTION: This is a component of the phosphoenolpyruvate-dependent sugar phosphotransferase system (PTS), a major carbohydrate active transport system. The IICD domains contain the sugar binding site and the transmembrane channel; the IIA domain contains the primary phosphorylation site (the donor is phospho-HPP); IIA transfers its
01-OCT-1996 (Rel. 34, Createu, 01-OCT-1996 (Rel. 34, Last sequence update) 25-OCT-2004 (Rel. 45, Last annotation update) PTS system, arbutin-like IIBC component (Phosphotransferase enzyme II,
 phosphoryl group to the IIB domain which finally transfers it to
 CATALYTIC ACTIVITY: Protein N-phosphohistidine + sugar = protein histidine + sugar phosphare.
SUBCELLULAR LOCATION: Integral membrane protein (Probable).
INDUCTION: By maltose; repressed by glucose.

LISUALIARARIY: Endopeptidase activity, May play a role in the biomineralization of enamel and dentin. Diomineralization of enamel and dentin.

LOTALIYITC ACTIVITY: Endopeptidase activity, Activates progelatinase A by cleavage of the propeptide at 37-Asn-|-Leu-38. Cher bonds hydrolyzed include 35-Gly-|-Ile-36 in the propeptide of collagenase 3, and 341-Asn-|-Phe-342, 441-Asp-|-Leu-442 and 34-Asn-|-The-355 in the aggreen interglobular domain.

LOGACTOR: Binds 1 zinc ion per subunit, calcium (By similarity).

LISSUE SPECIFICITY: Highly expressed in Geveloping tooth tissues.

LISSUE SPECIFICITY: Highly expressed in developing tooth tissues.

LISSUES SPECIFICITY: Highly expressed in developing tooth tissues.
